

Project Description

Supervisors:

Ib Havn
Erland Ketil Larsen
Kasper Knop Rasmussen
Knud Erik Rasmussen
Lars Bech Sørensen

Students:

Josipa Babic – 266757
Eduard Nicolae Costea -266078
Diyar Hussein Hussein – 266352
Kenneth Ulrik Petersen – 269379
Angel Iliyanov Petrov – 266489
Remedios Pastor Molines – 266100
Ionel-Cristinel Putinica – 266123
Erika Monica- Szasz- 280201
Christian Schou Sørensen – 267142
Mihai Tirtara - 266097

1. Background description

Indoor plants can be a great addition to homes because they present a multitude of benefits such as improving air quality by removing carbon dioxide while providing extra oxygen and the exposure to them reduces stress levels, boosts mental health, calms anxiety and lowers blood pressure. Also, they improve productivity and concentration, which is great for people who work from home and need a boost to focus on the work at hand. Plus, they help regulate humidity and increase levels of positivity. It is equally important to mention that plants can help diversify bacteria in our bodies to fight infections and allergies which is very crucial for city dwellers who are less likely to be exposed to nature daily, therefore their immunity can be influenced negatively without the presence of indoor greenery (Tobebright, 2018).

Having discussed about all the positive sides of owning indoor plants, there are some downsides as well. For people who live in apartments the responsibility of keeping a plant alive might not be such an easy task. Also, when they leave their apartment for a longer period of time, their green space needs to be taken care of and that can also represent a problem. There are some constraints such as limited space and lack of natural light which can limit the lifetime of many plants, making maintenance feel overwhelming (Tonelli & Kelsey, 2018). If the indoor garden is on a somewhat wider scale, the care taking routine of plants requires even more devoted time and attention. Unfortunately, these aspects may determine many people to give up the plants they own or prevent them from buying new ones. In this situation, a solution to increase the lifespan of plants and make their caretaking effortless is necessary.

When deciding to own plants, people should first consider what kinds of plants work best with their lifestyle and environment. Luckily, there is a wide variety of plants to choose from starting with low-maintenance ones such as cactuses, to high-maintenance tropical plants. But even the most low-maintenance ones still require some level of attention (Mindbodygreen, 2018). For this purpose, monitoring the external conditions of the plant such as the air humidity and temperature could play a key factor in providing it with the right care that includes tasks such as watering the plant and turning up the heat.

2. Definition of purpose

The purpose of this project is to design a product that will make the maintenance of indoor plants a simpler task.

3. Problem Statement

This project will focus on answering the following question: How can technology make maintenance of plants easier?

Questions to be answered are the following:

- What are the conditions that mostly affect the growth of plants?
- What is the relevant information that the system will provide to the user regarding the situation of the plants?
- How can information about different plants be gathered and used to make maintenance of plants more accessible?
- How will the information be presented to the user?

4. Delimitation

- System will not present the information in any other way, apart from the use of a mobile application.
- System will not monitor conditions apart from those mentioned in the background descriptions. Examples include pressure, soil PH levels and wind speed.
- System will not provide other information except the measured conditions.

5. Choice of models and methods

What?	Why?	Which?
How are the conditions going to be measured?	The team must know what hardware to use for the IOT part of the project.	Sensors: Humidity and temperature
How will data be managed in the system?	The project needs to generate statistics based on data for business intelligence in the company.	Extract, transform and load data into a data warehouse.
How will work be distributed among team members?	The project consists of three different parts and the development team has 10 members, so work must be partitioned.	SCRUM and AUP

How will the user interact with the product?	The project consists of different parts and hardware types and it must be established what platform the customer should interact with.	Mobile application
--	--	--------------------

6. Time schedule

Modifications and additions to the Design can always appear, and so, as a result, the group has planned to spend extra time into Implementation and Testing. Keeping in mind that one ECTS is equivalent to 27,5 hours of work, every group member will put roughly 140 hours of work in this project, the combined amount of work for the project summing up to about 1400 hours.

A VISUAL REPRESENTATION ON THE AMOUNT OF HOURS TO BE SPENT ON THE PHASES OF THE PROJECT.

Timeline of project period:

7. Risk assessment

Risk	Description	Likelihood (Scale 1-10)	Severity (Scale 1-10)	Product of likelihood and severity	Risk mitigation	Identifiers	Responsible
1	Delay	4	5	10	Check schedule regularly, make sure the time is enough	Missing the deadlines for the scrum sprints	Remedios
2	Illness	2	4	4	Make sure both physical and mental condition are favorable	Missing meetings and slowing the development of the project	Christian
3	Lack of necessary professional knowledge	4	3	6	Search online for information or seek help from the supervisors.	Facing difficulties when designing and implementing the project.	Ionel
4	Failure of hardware	2	5	5	Proper using and well maintaining of the equipment	Faulty sensors, boards etc.	Kenneth
5	Loss of information	2	5	5	Use clouding services such as GitHub and Google Drive to store all project work	Missing information, code, documents, etc..	Mihai
6	Failure of Database	2	4	4	Use of backup for databases	Unable to retrieve or load information from the database	Josipa

7	Synchronization between teams	4	5	10	Constant communication between groups	The project development is slowed	Erika
8	Group member not participating or not committed	6	6	6	Give warnings in case of such events	The project development is slowed, the team is demotivated	Angel
